

Newstamp integrates the PJF group in 2001, complementing it with the production of metal components, providing our customers integrated solutions, from the development of tooling to mass production.

Since 2006 we have accumulated experience in aesthetic components mainly in stainless steel and aluminium, first for the food service industry and since 2010 for the automotive industry, today we are experts in components of high visual criteria for high-end products.

In the year 2017 we inaugurated our new production unit with new pavilion, more means and technological resources to face the growth of the company.

In 2018 we created a new business area aimed at producing Carbon Fiber Composite Components for the most demanding applications and markets. We want to diversify, not only working with metal and we believe that the composites are the materials of tomorrow.

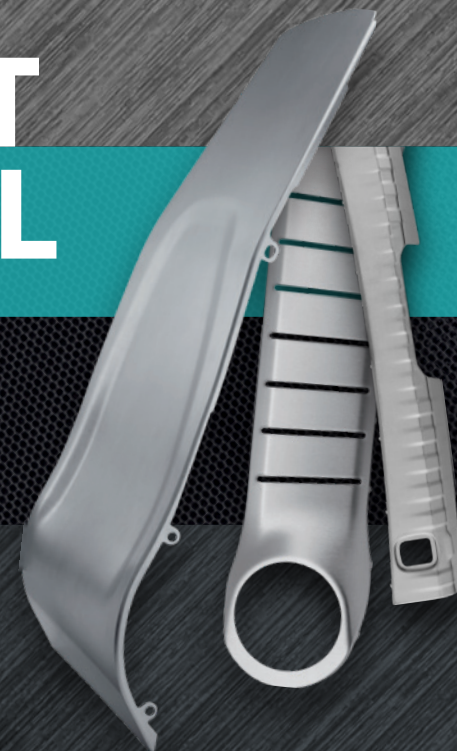

We have a metrology laboratory that ensures compliance with the requirements of our clients.
